PVG 32 Proportional Valve Technical Information General

GENERAL

Valve system

PVG 32 is a hydraulic load sensing valve designed to give maximum flexibility. From a simple load sensing directional valve, to an advanced electrically controlled load-independent proportional valve.

The PVG 32 module system makes it possible to build up a valve group to meet requirements precisely. The compact external dimensions of the valve remain unchanged whatever combination is specified.

General features PVG 32

- Load-independent flow control:
 - Oil flow to an individual function is independent of the load pressure of this function
 - Oil flow to one function is independent of the load pressure of other functions
- Good regulation characteristics
- Energy-saving
- Up to 10 basic modules per valve group
- Several types of connection threads
- Low weight

PVP – pump side module

- Built-in pressure relief valve
- System pressure up to 350 bar [5075 psi]
- Pressure gauge connection
- Versions:
 - Open centre version for systems with fixed displacement pumps
 - Closed centre version for systems with variable displacement pumps
 - Pilot oil supply for electrical actuator built into the pump side module
 - Versions prepared for electrical LS unloading valve PVPX

PVB, basic module

- Interchangeable spools
- Depending on requirements the basic module can be supplied with:
 - Integrated pressure compensator in channel P
 - Check valve in channel P
 - Shock/suction valves
 - LS pressure limiting valves individually adjustable for ports A and B
 - Different spool variants

PVG 32 Proportional Valve

Technical Information

General

GENERAL

Actuation modules

The basic module is always fitted with mechanical actuator PVM, which can be combined with the following as required:

- Electrical actuator (12 V $\overline{\text{---}}$ or 24 V $\overline{\text{---}}$)
 - PVES – proportional, super
 - PVEH – proportional, high performance
 - PVEM – proportional, medium performance
 - PVEO – ON/OFF
- PVMD, cover for mechanical actuation
- PVMR, cover for mechanical detent
- PVMF, cover for mechanical float
- PVH, cover for hydraulic actuation

ACCESSORIES

Remote control units

- Electrical remote control units
 - PVRE, PVRET
 - PVREL
 - PVRES
 - Prof 1
 - Prof 1 CIP
- Hydraulic remote control unit
 - PVRHH

Electronics

- EHF, flow adjustment unit
- EHR, ramp generator
- EHS, speed control
- EHSC, closed loop speed control
- EHA, alarm logic
- EHC, closed loop position control
- PVG CIP
- CIP Configuration Tool

PVG 32 Proportional Valve

Technical Information

Function

PVG 32 VALVE GROUP WITH OPEN CENTRE PVP (PVB WITH FLOW CONTROL SPOOL)

When the pump is started and the main spools in the individual basic modules (11) are in the neutral position, oil flows from the pump, through connection P, across the pressure adjustment spool (6) to tank. The oil flow led across the pressure adjustment spool determines the pump pressure (stand-by pressure).

When one or more of the main spools are actuated, the highest load pressure is fed through the shuttle valve circuit (10) to the spring chamber behind the pressure adjustment spool (6), and completely or partially closes the connection to tank.

Pump pressure is applied to the right-hand side of the pressure adjustment spool (6). The pressure relief valve (1) will open should the load pressure exceed the set value, diverting pump flow back to tank.

In a pressure-compensated basic module the compensator (14) maintains a constant pressure drop across the main spool – both when the load changes and when a module with a higher load pressure is actuated.

With a non pressure-compensated basic module incorporating a load drop check valve (18) in channel P, the check valve prevents return oil flow. The basic module can be supplied without the load drop check valve in channel P for functions with over-centre valves.

The shock valves PVLP (13) with fixed setting and the suction valves PVLA (17) on ports A and B are used for the protection of the individual working function against overload and/or cavitation.

An adjustable LS pressure limiting valve (12) can be built into the A and B ports of pressure-compensated basic modules to limit the pressure from the individual working functions.

The LS pressure limiting valves save energy compared with the shock valves PVLP:

- With PVLP all the oil flow to the working function will be led across the combined shock and suction valves to tank if the pressure exceeds the fixed setting.
- With LS pressure limiting valves an oil flow of about 2 l/min [0.5 US gal/min] will be led across the LS pressure limiting valve to tank if the pressure exceeds the valve setting.

PVG 32 VALVE GROUP WITH CLOSED CENTRE PVP (PVB WITH FLOW CONTROL SPOOL)

In the closed centre version an orifice (5) and a plug (7) have been fitted instead of the plug (4). This means that the pressure adjustment spool (6) will only open to tank when the pressure in channel P exceeds the set value of the pressure relief valve (1).

In load sensing systems the load pressure is led to the pump regulator via the LS connection (8).

In the neutral position the pump control sets the displacement so that leakage in the system is compensated for, to maintain the set stand-by pressure.

When a main spool is actuated the pump regulator will adjust the displacement so that the set differential pressure between P and LS is maintained.

The pressure relief valve (1) in PVP should be set at a pressure of approx. 30 bar [435 psi] above maximum system pressure (set on the pump or external pressure relief valve).

Technical Information
Function

**PVPC,
PLUG FOR EXTERNAL
PILOT OIL SUPPLY**

PVPC with check valve for open centre PVP

PVPC with check valve is used in systems where it is necessary to operate the PVG 32 valve by means of the electrical remote control without pump flow.

When the external solenoid valve is opened, oil from the pressure side of the cylinder is fed via the PVPC through the pressure reducing valve to act as the pilot supply for the electrical actuators.

157-114.10

This means that a load can be lowered by means of the remote control lever without starting the pump. The built-in check valve prevents the oil from flowing via the pressure adjustment spool to tank. With the pump functioning normally the external solenoid valve is closed to ensure that the load is not lowered due to the pilot supply oil flow requirement of approximately 1 l/min [0.25 US gal/min].

157-116.10

Please note:

With closed centre PVP the external pilot oil supply can be connected to the pressure gauge connection without the use of a PVPC plug.

PVG 32 Proportional Valve
Technical Information
Function

**PVPC,
PLUG FOR EXTERNAL
PILOT OIL SUPPLY**

**PVPC without check valve
for open or closed centre PVP**
PVPC without check valve is used in systems where it is necessary to supply the PVG 32 valve with oil from a manually operated emergency pump without directing oil flow to the pilot oil supply (oil consumption about 1 l/min) [0.25 US gal/min].

When the main pump is working normally, the oil is directed through the PVPC plug via the pressure reduction valve to the electrical actuators.

When the main pump flow fails, the external shuttle valve ensures that the oil flow from the manually operated emergency pump is used to pilot open the over centre valve and lower the load. The load can only be lowered using the mechanical operating lever of the PVG 32 valve.

Technical Information
Function

**PVMR,
FRICTION DETENT**

PVMR, Friction Detent
The friction detent PVMR allows the directional spool to be held in any position, resulting in infinitely variable, reversible, pressure compensated flow. This can be sustained indefinitely without having to continue to hold the mechanical lever.

Please note:
PVMR should only be used together with PVB basic modules with pressure compensator.

PVMR

PVG 32 Proportional Valve
Technical Information
Function

**PVBS,
MAIN SPOOLS FOR FLOW
CONTROL (STANDARD)**

When using standard flow control spools, the pump pressure is determined by the highest load pressure. This is done either via the pressure adjustment spool in open centre PVP (fixed displacement pumps) or via the pump regulator (variable displacement pumps).

In this way the pump pressure will always correspond to the load pressure plus the stand-by pressure of the pressure adjustment spool or the pump regulator. This will normally give optimum and stable adjustment of the oil flow.

**PVBS,
MAIN SPOOLS
FOR FLOW CONTROL
(WITH LINEAR
CHARACTERISTIC)**

PVBS main spools with linear characteristic have less dead band than standard spools and a completely proportional ratio between control signal and oil flow in the range beyond the dead band. PVBS with linear characteristic must never be used together with PVEM electrical actuators. The interaction between the small dead band of the spools and the hysteresis of the PVEM actuator of 20% involves a risk of building up a LS pressure in neutral position.

**PVBS,
MAIN SPOOLS FOR
PRESSURE CONTROL**

In a few systems load sensing pump pressure may result in unstable adjustment of the oil flow and a tendency towards system hunting. This may be the case with working functions that have a large moment of inertia or over-centre valves. In such systems main spools for pressure control can be advantageous.

The spools are designed in such a way that the pump pressure is controlled by the spool travel. The main spool must be displaced until the pump pressure just exceeds the load pressure before the working function is applied. If the main spool is held in this position, the pump pressure will remain constant – even if the load pressure changes – giving a stable system.

The use of pressure control spools, however, also means that

- the oil flow is load dependent
- the dead band is load dependent
- the pump pressure can exceed the load pressure by more than is usual.

Due to these factors it is recommended that pressure control spools are only used when it is known for certain that problems with stability will arise – or already have arisen.

157-156.10

PVG 32 Proportional Valve Technical Information Function

PVPX, ELECTRICAL LS UNLOADING VALVE

PVPX is a solenoid LS unloading valve. PVPX is fitted into the pump side module enabling a connection to be made between the LS and the tank lines. Thus the LS signal can be relieved to tank by means of an electric signal.

For a PVP pump side module in open centre version the relief to tank of the LS signal means that the pressure in the system is reduced to the sum of the tank port pressure plus the neutral flow pressure for the pump side module.

For a PVP pump side module in closed centre version the relief to tank of the LS signal means that the pressure is reduced to the sum of the tank port pressure for the pump side module plus the stand-by pressure of the pump.

PVG 32 Proportional Valve
Technical Information
Electrical actuation

**PVEO,
ON-OFF**

Main features of PVEO:

- Compact
- Robust operation
- Simple build-up

157-99.10

**PROPORTIONAL
ACTUATION**

With electrical proportional actuation the main spool position is adjusted so that it corresponds to an electric signal – from a remote control unit, for example.

The signal (set-point signal) is converted into a hydraulic pressure which moves the main spool. The position of the main spool is converted in the positional transducer (C) to an electric signal (feed-back signal). This signal is registered by the electronics. The variation between the set-point signal and feed-back signal actuates the solenoid valves. The solenoid valves are actuated so that hydraulic pressure moves the main spool into the correct position.

**PVEM,
PROPORTIONAL MEDIUM**

PVEM versions are recommended where there is a requirement for simple proportional control and where reaction and hysteresis are not critical. Main features of PVEM:

- ON-OFF modulated
- Inductive transducer, see page 17
- Medium hysteresis

157-49.10

**PVEH,
PROPORTIONAL HIGH**

PVEH versions are recommended where among the requirements are fault monitoring, fast system reaction, low hysteresis and fine regulation.

Main features of PVEH:

- Inductive transducer, see page 17
- Integrated pulse width modulation, see page 17
- Short reaction time
- Low hysteresis
- Fault monitoring, see page 17 and 18
- Transistor output for signal source, see page 19

157-48.10

PVG 32 Proportional Valve
Technical Information
Electrical actuation

**PVES,
PROPORTIONAL SUPER**

PVES versions are recommended for control systems requiring very low hysteresis to obtain a very fine regulation. For other technical data: see PVEH.

157-48.10

**LVDT-TRANSDUCER,
PULSE WIDTH
MODULATION**

Inductive transducer, LVDT

(Linear Variable Differential Transformer). When the main spool is moved, a voltage is induced proportional to the spool position. The use of LVDT gives contact-free (proximity) registration of the main spool position. This means an extra-long working life and no limitation as regards the type of hydraulic fluid used. In addition, LVDT gives a precise position signal of high resolution.

Integrated pulse width modulation

Positioning of the main spool in PVEH is based on the pulse width modulation principle. As soon as the main spool reached the required position, modulation stops and the spool is locked in position.

**THE FAULT MONITORING
SYSTEM**

A fault monitoring system is provided in all PVEH and PVES models. The system is available in two versions: – The active fault monitoring type, which provides a warning signal and deactivates the solenoid valves, and the passive fault monitoring type, which provides a warning signal only. See page 19.

Both active and passive fault monitoring systems are triggered by three main events:

Input signal monitoring

The input signal voltage is continuously monitored. The permissible range is between 15% and 85% of the supply voltage. Outside this range the section will switch into an active error state.

Transducer supervision

If one of the wires to the LVDT sensor is broken or short-circuited, this section will switch into an active error state.

PVG 32 Proportional Valve

Technical Information

Electrical actuation

THE FAULT MONITORING SYSTEM (CONTINUED)

Supervision of the closed loop

The actual position must always correspond to the demanded position (input signal). When the distance from neutral to the actual position is longer than the demanded distance, the system detects an error and will switch into an active error state. On the other hand, a situation where the actual position is closer to neutral than that demanded will not cause an error state. This situation is considered "in control".

When an active error state occurs, the fault monitoring logic will be triggered:

Note:

The neutral deadband prevents the output signal from releasing the fault monitoring logic, thus stopping the function until the required pilot oil pressure has been developed.

Active fault monitoring

- A delay of 500 ms before anything happens.
- The solenoid valve bridge will be disabled, - all solenoids will be released.
- An alarm signal is sent out through the connector.
- This state is memorized and continues until the system is actively reset (by turning off the supply voltage).

Passive fault monitoring

- A delay of 250 ms before anything happens.
- An alarm signal is sent out through the connector.
- This state is not memorized. When the erroneous state disappears, the alarm signal will turn to passive again. However, the signal will always be active for a minimum of 100 ms when triggered.

To prevent the electronics from going into an undefined state, a general supervision of the power supply and the internal clock frequency is made. This function applies to PVEH, PVES and PVEM:

High supply voltage

The solenoid valves are disabled when the supply voltage is exceeded by 50% (18 V for a 12 V PVE and 36 V for a 24 V PVE).

Low supply voltage:

The solenoid valves are disabled when the supply voltage falls below 8 V.

Internal clock

The solenoid valves are disabled when the internal clock frequency fails.

All three states are triggered automatically when the fault conditions cease.

Note:

1. Different degrees of safety are described on pages 50 to 53.
2. The fault monitoring does not work if the supply voltage to PVEH/PVES is cut off – for example by a neutral position switch (see page 50).
3. When using PVEH/PVES with passive fault monitoring it's up to the customer to decide on the required degree of safety for the system (see page 50).

Transistor output function

Example of connected components

A: External relay
B: Solenoid valve (e.g. PVPX)

A: External relay
B: Solenoid valve (e.g. PVPX)

Via an external relay the pin pos. 3 can be connected to a solenoid valve which will relieve the LS-signal to tank, e.g. PVPX.

Other connections possible:

- a solenoid valve to relieve the pump oil flow
- a signal lamp, an alarm horn
- pump cut-out, etc.

PVG 32 Proportional Valve
Technical Information
Technical characteristics

GENERAL

The characteristics in this catalogue are typical measured results.
During measuring a mineral based hydraulic oil with a viscosity of 21 mm²/s [102 SUS] at a temperature of 50°C [122°F] was used.

**PVP,
PUMP SIDE MODULE**

**Pressure relief valve characteristic
in PVP**

The pressure relief valve is set at an oil flow of 15 l/min [4.0 US gal/min].

Setting range:
30 to 350 bar [435 to 5075 psi]
(with PVS1 end plate) and
(300 bar [4351 psi] (with PVS end plate)

157-83.10

**Neutral flow pressure in PVP,
open centre**

157-184.10

PVG 32 Proportional Valve
Technical Information
Technical characteristics

PVB,
BASIC MODULE

Oil flow characteristics

The oil flow for the individual spool depends on

- type of basic module (with/without compensation)
- type of pump (fixed or variable displacement).

Please note:

The letters AA, A, B, etc. denote spool types, see pages 56 to 62. The characteristic below is shown for spool travel in both directions. All other characteristics are shown for spool travel in one direction only.

Pressure-compensated PVB, open or closed centre PVP

The oil flow is dependent on the supplied pump oil flow. The characteristics are plotted for a pump oil flow, Q_p , corresponding to the rated max. spool oil flow, Q_N . Increasing the pump oil flow to $1,4 \times Q_N$ will give the same oil flow on the eighth as on the first basic module.

157-61.10

- U_s = Signal voltage
- U_{DC} = Supply voltage
- 1 = First PVB after PVP
- 8 = Eighth PVB after PVP

PVG 32 Proportional Valve
Technical Information
Technical characteristics

**PVB,
BASIC MODULE**

Pressure compensated PVB, open or closed centre PVP
Linear characteristic

Please note:

For PVB basic modules without pressure compensator the top ends of the characteristics (max. oil flow) are different so they correspond to those of the standard flow control spools, see characteristics for PVB without pressure compensator.

- U_s = Signal voltage
- U_{DC} = Supply voltage
- 1 = First PVB after PVP
- 8 = Eighth PVB after PVP

PVG 32 Proportional Valve
Technical Information
Technical characteristics

**PVB,
BASIC MODULE**

PVB without pressure compensation, open centre PVP

Oil flow as a function of spool travel.

The spool flow is dependent on the supplied oil flow, Q_p . The characteristics apply to supply oil flow of 130 l/min [34.3 US gal/min] with the actuation of one basic module. If several basic modules are activated at the same time, the characteristic depends on the load pressure of the actuated basic modules.

PVG 32 Proportional Valve
Technical Information
Technical characteristics

**PVB,
BASIC MODULE**

PVB without pressure compensation, open centre PVP

Oil flow $Q_{A/B}$ as a function of supplied pump oil flow (Q_p) – curves for fully displaced flow control spools.

The pressure drop of any oil flowing back to tank ($Q_p - Q_{A/B}$) is read on the curve for neutral flow pressure in PVP, page 30.

157-212.10

PVG 32 Proportional Valve
Technical Information
Technical characteristics

**PVB,
BASIC MODULE**

PVB without pressure compensation, closed centre PVP

Set pressure difference between pump pressure and LS signal = 10 bar [145 psi].

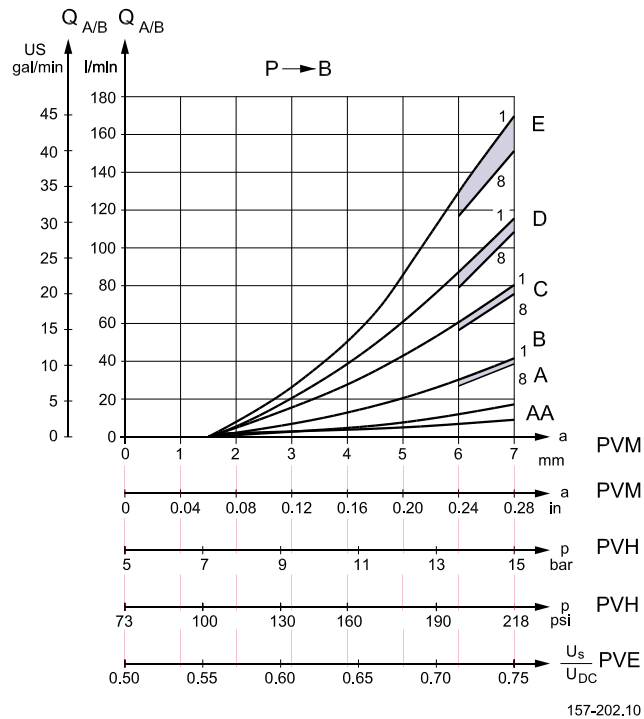

PVG 32 Proportional Valve
Technical Information
Technical characteristics

**PVB,
BASIC MODULE**

PVB without pressure compensation, closed centre PVP

Set pressure difference between pump pressure and LS signal = 20 bar [290 psi].

The oil flow is dependent on the pressure difference between the pump pressure and the LS signal. Normally the pressure difference is set at the LS pump regulator.

**PVLP,
SHOCK AND
SUCTION VALVE**

PVLP, shock valve

PVLP is set at an oil flow of 10 l/min [2.6 US gal/min].

The shock valve PVLP is designed to absorb shock effects. Consequently, it should not be used as a pressure relief valve.

If the working function requires the use of a pressure relief valve, a PVB basic module with built-in $LS_{A/B}$ pressure limiting valve should be used.

2: See example page 40

157-160.10

**PRESSURE CONTROL
SPOOLS,
CHARACTERISTICS IN
EXTREME POSITIONS**

Size E:

157-214.10

Pressure build-up

Max. oil flow can be reduced by about 50% without limitation of maximum pressure by limiting the main spool travel from 7 mm [0.28 in] to 5.5 mm [0.22 in]

157-156.10

**EXAMPLES OF HOW
TO USE THE
CHARACTERISTICS FOR
PRESSURE CONTROL
SPOOLS**

Example of determining the oil flow

- Given:
 - Spool type B
 - Pressure setting P_p : 160 bar [2320 psi]
 - Load pressure, $LS_{A/B}$: 100 bar [1450 psi]
- Result:
 - Oil flow = 75 l/min [19.8 US gal/min] (see page 39, size B).

Example of determining spool size

- Given:
 - Max. oil flow, $Q_{A/B}$: 90 l/min [23.8 US gal/min]
 - Pressure setting P_p : 150 bar [2175 psi]
 - Load pressure, $P_{LS A}$: 125 bar [1810 psi]
- Result:
 - D spool (see page 39, size D)

Please note:

Normally a smaller spool can be chosen with pressure control. It is our experience that the spool can be one size smaller than with normal flow control.

PVG 32 Proportional Valve
Technical Information
Technical characteristics

**CHARACTERISTICS FOR
FLOAT POSITION MAIN
SPOOLS**

Characteristics; oil flow, spool travel and voltage

The spools have 4,8 mm spool travel in direction A and 8 mm travel in direction B:

- 4.8 mm [0.19 in] spool displacement in direction A gives max. oil flow to port A
- 4.8 mm [0.19 in] spool displacement in direction B gives max. oil flow to port B
- 8 mm [0.32 in] spool displacement in direction B gives completely open float position A/B → T.

a PVM
a PVM
 $\frac{U_s}{U_{DC}}$ PVE
157-171.10

Pressure drop A/B → T at max. spool travel within the proportional range (4.8 mm) [0.19 in].

157-181.10

Spools D and E have the same opening area for forward flow and return flow. Spool E can give 100 l/min [26.4 US gal/min] pressure compensated oil flow due to a higher pressure drop across spool E. This occurs during spool actuation only.

**ELECTRICAL
CONNECTIONS, GENERAL**

The electrical connections to remote control levers, PVE actuators and voltage supply are made using an ordinary terminal strip.

The wiring diagrams below and on page 50 to 53 show only the basic outlines for the electrical connection.

Voltage supply

For a main transformer with stabilised output voltage, the ripple must not exceed 5% of rated voltage.

**ELECTRICAL
CONNECTION EXAMPLE**

Signal leads must not act as supply leads at the same time unless the distance between the actuator module PVE and terminal board is less than 3 m [3.3 yards] and the lead cross-section is min. 0.75 mm² [AWG 18].

PVG 32 Proportional Valve Technical Information System safety

BUILDING IN SAFETY

All makes and all types of directional control valves (incl. proportional valves) can fail. Thus the necessary protection against the serious consequences of function failure should always be built in.

For each application an assessment should be made of the consequences of pressure failure and uncontrolled or blocked movements.

To determine the degree of protection that ought to be built into the system, Sauer-Danfoss makes the following distinctions.

1. Maximum safety demands
2. High safety demands
3. Average safety demands
4. Limited safety demands.

**1.
MAXIMUM SAFETY
DEMANDS**

When the fault monitoring system in PVEH is connected, the reaction to electrical and mechanical faults (e.g. a spool seizure) is fast and operator-independent. See page 17 "fault monitoring".

A system can be protected against many electrical, hydraulic and mechanical faults by building in components as shown in the diagram:

- R: Alarm logic EHA (or relay) connected to the fault monitoring system in PVEH
- E: Electrical emergency stop
- M: Solenoid valve
- C: Pilot-operated check valve

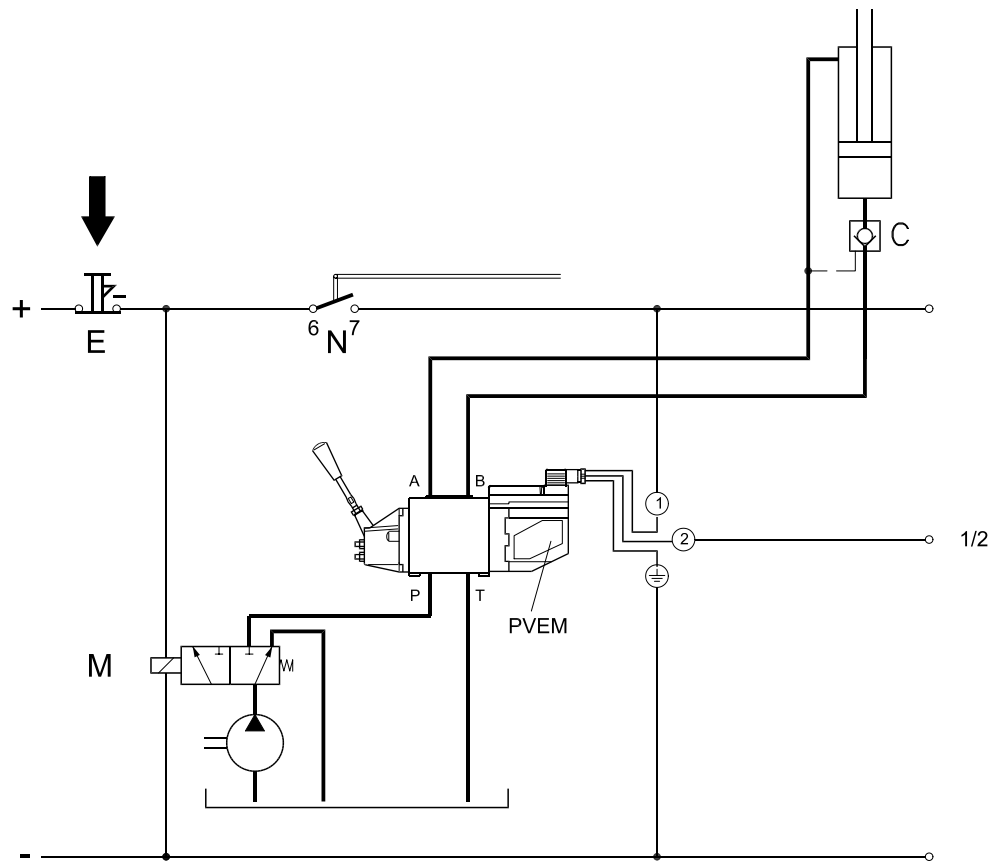

The alarm logic EHA cuts off current to the solenoid valve (M) when PVEH monitoring registers a fault. The solenoid valve then leads the oil flow direct from pump to tank. Thus all functions are without operating pressure, i.e. locked in position, because there is no pilot pressure on the pilot operated check valve (C).

Actuation of the emergency switch (E) cuts off current to the proportional valve and the solenoid valve (M). Actuation in this case is manual, but the result is the same as above. Stopping or disconnecting the pump drive motor is another safety measure, if the system reaction time can be accepted.

Note:

The neutral position switch in the remote control units should not be used. PVEH with fault monitoring must have a constant voltage supply.

**2.
HIGH SAFETY DEMANDS**

157-101.10

The difference between this safety method and the one previously described (1) is that here there is no built-in automatic fault monitoring and a neutral position switch (N) is connected.

The method still gives a high degree of protection, but requires operator intervention. It is recommended that the neutral position switch be always connected to the electrical system. This then automatically cuts off current to the proportional valve when the remote control unit is in neutral position.

**3.
AVERAGE SAFETY
DEMANDS**

The difference from the previous method is that the LS- signal from the proportional valve is led direct to tank when the emergency switch (E) is actuated. This can be achieved by using the Sauer-Danfoss LS unloading valve PVPX, integrated in the pump side module.

In a system with open centre PVP and a fixed displacement pump, the effect of the PVPX is an almost pressureless system, 8-14 bar [120-200 psi] i.e. all functions requiring a higher operating pressure will not operate, see page 11.

The method can also be used in LS systems with a variable displacement pump and closed centre version proportional valve.
The pressure after LS relief then depends on the pump stand-by pressure.

**4.
LIMITED SAFETY
DEMANDS**

The safety system can consist of an emergency switch (E) and a neutral position switch (N) if protection against electrical failure is the only requirement. Here, there is no protection against hydraulic and mechanical faults (spool seized in an extreme position).

PVG 32 Proportional Valve Technical Information Other operating conditions

OIL

The main duty of the oil in a hydraulic system is to transfer energy; but it must also lubricate the moving parts in hydraulic components, protect them against corrosion, and transport dirt particles and heat out of the system. It is therefore important to choose the correct oil with the correct additives. This gives normal operation and long working life.

Mineral oil

For systems with PVG 32 valves Sauer-Danfoss recommends the use of mineral-based hydraulic oil containing additives: Type HLP (DIN 51524) or HM (ISO 6743/4).

Non-flammable fluids

Phosphate-esters (HFDR fluids) can be used without special precautions. However, dynamic seals must be replaced with FPM (Viton) seals.

So please contact the Sauer-Danfoss Sales Organization if the PVG 32 valve is to be used with phosphate-esters.

The following fluids should only be used according to agreement with the Sales Organization for Sauer-Danfoss:

- Water-glycol mixtures (HFC fluids)
- Water-oil emulsions (HFB fluids)
- Oil-water emulsions (HFAE fluids)

Biodegradable oils

PVG 32 valves can be used in systems with rapeseed oil. The use of rapeseed oil is conditioned by

- complying with the demands on viscosity, water content, temperature and filtering etc. (see chapters below and technical data page 12).
- adapting the operating conditions to the directions of the oil supplier.

Before using other biodegradable fluids, please consult the Sauer-Danfoss Organization.

PARTICLE CONTENT, DEGREE OF CONTAMINATION

Oil filtration must prevent particle content from exceeding an acceptable level, i.e. an acceptable degree of contamination.

Maximum contamination for PVG 32 is 19/16 (see ISO 4406. Calibration in accordance with the ACFTD method).

In our experience a degree of contamination of 19/16 can be maintained by using a filter fineness as described in the next section.

PVG 32 Proportional Valve Technical Information Other operating conditions

FILTRATION

Effective filtration is the most important precondition in ensuring that a hydraulic system performs reliably and has a long working life. Filter manufacturers issue instructions and recommendations. It is advisable to follow them.

System filters

Where demands on safety and reliability are very high a pressure filter with bypass and indicator is recommended. Experience shows that a 10 µm nominal filter (or finer) or a 20 µm absolute filter (or finer) is suitable.

It is our experience that a return filter is adequate in a purely mechanically operated valve system.

The fineness of a pressure filter must be selected as described by the filter manufacturer so that a particle level of 19/16 is not exceeded.

The filter must be fitted with pressure gauge or dirt indicator to make it possible to check the condition of the filter.

In systems with differential cylinders or accumulators the return filter must be sized to suit the max. return oil flow. Pressure filters must be fitted to suit max. pump oil flow.

Internal filters

The filters built into PVG 32 are not intended to filter the system but to protect important components against large particles. Such particles can appear in the system as a result of pump damage, hose fracture, use of quick-couplings, filter damage, starting up, contamination, etc.

The filter in the electrical actuator PVE protecting the solenoid valves has a mesh of 150 µm.

Bursting pressure drop for internal filters is 25 bar [360 psi].

PVG 32 Proportional Valve

Technical Information

Order specification

ORDER SPECIFICATION

An order form for Danfoss PVG 32 hydraulic valve is shown on the next page. The form can be obtained from the Sauer-Danfoss Sales Organization.

Both the module selection chart on the previous pages and the order form are divided into fields 0, 1-10, 11, 12, 13, a, b, and c.

Each module has its own field:

- 0: - Pump side module PVP
- Plug for external pilot oil supply PVPC
- Electrical LS unloading valve PVPX
- 1-10: Basic valves PVB
- 13: Main spool PVBS
- a: Mechanical actuator PVM (or PVE when option mounted)
- c: - Cover for mechanical actuation PVMD
- Cover for hydraulic actuation PVH
- Electrical actuators PVE (or PVE when option mounted)
- b: - Shock and suction valve PVLP
- Suction valve PVLA
- 11: End plate PVS
- 12: Assembly kit PVAS

Please state

- Code numbers of all modules required
- Required setting (P) for pump side module
- Required setting of $LS_{A/B}$ pressure limiting valves, see pressure setting guidance below.

Standard and option assembly

The PVG 32 valve group is assembled the way the module selection chart shows if the code number for PVM is written in field a, and the code number for PVMD, PVE or PVH in field c.

The valve group is assembled so that the mechanical actuator is mounted on the opposite end of the basic module, if the code number for PVM is written in field c of the order form and the code numbers for PVMD, PVE or PVH in field a.

Reordering

The space at the top right-hand corner of the form is for Danfoss to fill in.

The code number for the whole of the specified valve group (PVG No.) is entered here.

In the event of a repeat order all you have to do is enter the number Danfoss has given on the initial confirmation of order.

Technical Information
Order specification

ORDER SPECIFICATION

Pressure setting limits

The maximum setting pressure for the pressure limiting valves LS_A or LS_B depends on the chosen pressure setting for shock valve PVLP. The maximum values recommended to avoid interaction can be read in the following table.

The figures in the table have been calculated according to the following expressions:

- $PVLP \leq 150 \text{ bar}: LS_{A/B} \leq 0.8 \times P_{PVLP}$
- $PVLP > 150 \text{ bar}: P_{PVLP} - LS_{A/B} \geq 30 \text{ bar}.$

Max. pressure setting of LS_A and LS_B valves relative to PVLP shock valve

Setting pressure for PVL	bar	32	50	63	80	100	125	140	150	160	175	190	210	230	240	250	265	280	300	320	350

Sauer-Danfoss Hydraulic Power Systems – Market Leaders Worldwide

Sauer-Danfoss is a comprehensive supplier providing complete systems to the global mobile market.

Sauer-Danfoss serves markets such as agriculture, construction, road building, material handling, municipal, forestry, turf care, and many others.

We offer our customers optimum solutions for their needs and develop new products and systems in close cooperation and partnership with them.

Sauer-Danfoss specializes in integrating a full range of system components to provide vehicle designers with the most advanced total system design.

Sauer-Danfoss provides comprehensive worldwide service for its products through an extensive network of Authorized Service Centers strategically located in all parts of the world.
